# Vickers Hardness

- Two samples were evaluated
  - Two indentation loads (300g and 500g)
  - 500g tests had significant deformation
- Some cracking (acceptable per ASTM C1327)
- Vickers Hardness calculated per ASTM C1327:

3.3.4 For the Vickers hardness test, in practice, test loads are in grams-force and indentation diagonals are in micrometers. The Vickers hardness number is calculated as follows:

$$HV = 1.000 \times 10^3 \times P/A_s = 2.000 \times 10^3 \times P \sin(\alpha/2)/d^2 \quad (6)$$

or

$$HV = 1854.4 \times P/d^2 \quad (7)$$

where:

$P$  = force, gf,

$A_s$  = surface area of the indentation,  $\mu\text{m}^2$ ,

$d$  = mean diagonal length of the indentation,  $\mu\text{m}$ , and

$\alpha$  = face angle of the indenter,  $136^\circ 0'$  (see Fig. 2).
